

The figure is a horizontal dot plot with error bars. The x-axis is labeled with values -5000, 0, and 5000. A vertical dashed line is drawn at x=0. There are 1000 horizontal lines, each representing a simulated estimate. Each line has a central dot and horizontal error bars extending to the left and right. The dots are distributed across the x-axis, with a higher density around the 0 mark. The error bars vary in length, indicating different levels of uncertainty for each estimate.
